purge component-list; Xref component-name; It lists elements that depend from the ones in the component-list. Xref component-name; It lists elements that depend from the one indicated. To redefine an item of the model (even without deleting or purging it) fix varname := value; If fixes the indicated variable to the given value unfix varname; It relaxes the specified constraints, telling the solver to ignore it while solving the problem restore constraint-name; It reintroduces the constraint previously relaxed. option relax_integrality 1; option relax_integrality 0; option solver_mag 0;	AMPL COMMAND	DESCRIPTION
It loads instance data from the specified file	1.1.01	
It allows to specify the solver to use for solving the problem. Options available: cplex, gurdbi, minus, Ipsolve solve; It solves the instance of the problem. given the model and the data fooded before It solves the instance of the problem.	· · · · · · · · · · · · · · · · · · ·	It loads the model from the specified file
It solves the instance of the problem, given the model and the data loaded before	,	
display varname; It shows the value of the variable varname after solving the instance include filename; It shows the value of the variable varname after solving the instance include filename; It shows the value of the variable varname after solving the instance include filename; It shows the value of the variable varname after solving the instance include filename; It shows the value of the variable varname after solving the instance in the model and in the data files. It is also useful to solve the model several times with different solvers, in order to avoid that solutions details are automatically shared by solvers. This command resets only the information in the instance, not the model. This orneal resets only the specified data information in the data file. It updates data; It updates data without deleting them. It deletes omponent-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; Similar to the previous one, it also deletes elements that depend from the ones in the component-list. xref component-name; It is first the variable from previously set values It reintroduces the constraints, telling the solver to ignore it while solving the problem restore constraint-name; It reintroduces the constraints, telling the solver to ignore it while solving the problem restore constraint-name; It reintroduces the constraints, telling the solver to ignore it while solving the problem restore, and it is the previously set values It constraints the constraints of the object of the model which parameters and variables are based on param [8]; To disable message from solver To disable message from solver To define a variable To the constraint in the specified filename It changes the value or the definition of the object name It can be a parameter (i.e., constant		
It shows the value of the variable varname after solving the instance It allows to execute all specified commands in indicated file It completely resets every variable and parameter, both in the model and in the data files It completely resets every variable and parameter, both in the model and in the data files It is also useful to solve the model several times with different solvers, It is also useful to solve the model several times with different solvers, It is ada to useful that solutions details are automatically shared by solvers. Preset data component-list; This one resets only the specified data information in the data file. It update data; It updates data without deleting them. It updates data without deleting them. It updates only the specified data information in the data file. It updates data without deleting them. It updates only the specified data information in the data file. It updates data without deleting them. It is updates only the specified data information in the data file. It updates only the specified data information in the data file. It updates only the specified data information in the data file. It is updates only the specified data information in the data file. It is update solve the update data independ from the one indicated. It is updates only the specified data information in the data file. It is updates only the specified data information in the data file. It is elements that depend from the one indicated variable to the grown without deleting or purging it is the component-laname; It is elements that depend from the one indicated. It is elements that depend from the one indicated. It is component-laname; It relates the specified onstraints, telling the solver to ignore it while solving the problem It is related to the indicated variable to the given value It is related to the update value It is updates one value It is related to the update value It is related to the update value It is related to the update v	solve;	
Include filename; It allows to execute all specified commands in the indicated file It completely resets every variable and parameter, both in the model and in the data files. It is also useful to solve the model several times with different solvers, in order to avoid that solutions details are automatically shared by solvers. reset data; This command resets only the information but the instance, not the model. reset data component-list; It updates data without deleting them. It updates data component-list; It updates only the specified data information in the data file. delete component-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; It desters the list of object specified from the model of the problem, only if other items do not depend from then purge component-last; It desters the list of object specified from the model of the problem, only if other items do not depend from then purge component-last; It desters the list of object specified from the model of the problem, only if other items do not depend from then purge component-last; It desters the list of object specified from the model of the problem, only if other items do not depend from then purge component-last; It desters the list of object specified from the model of the problem, only if other items do not depend from then purge component-last; It desters the list of object specified from the one indicated. It desters the list of object a specified constraints, telling the solver to indicate the problem of the object and the problem prestore constraint-name; It reinaxes the specified constraints previously relaxed. option relax integrality 1; option relax integrality 1; option relax integrality 1; option relax integrality 1; option solution precision 10; It changes the value or the defini		
reset; It completely resets every variable and parameter, both in the model and in the data files. It is also useful to solve the model several is solvers, in order to avoid that solutions details are automatically shared by solvers. reset data; This command resets only the information about the instance, not the model. reset data component-list; It is command resets only the specified data information in the data file. It update data; It updates data without deleting them. update data component-list; It updates only the specified data information in the data file. delete component-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; Similar to the previous one, it also deletes elements that depend from the ones in the component-list. redeclare declaration; To redefine an item of the model (even without deleting or purging it) It fixes the indicated variable to the given value unfix varname; It frees the variable from previously set values drop constraint-name; It relaxes the specified constraint, reviously relaxed. option relax integrality 1; option relax integrality 0; option solver.msg 0; option solver.msg 0; option solver.msg 0; option solver.msg 0; option solvition.precision 10; It changes the value or the definition of the object name set A; It clauses the value or the definition of the object name for define a variable minimize/maximize functionname: To define a parameter (i.e., constant numeric values) To define a variable for [1.n.] commands filename; It commands filename; To define a variable To introduce a constraint To great will expression { }; repeat while expression { }; To define a variable numerical parameter (i.e., constant numeric values) To define a variable for proving solution precision is verified repeat will expression { }; To peat introduce a constraint To display varname.down; and display varname.up; To display the reduced cost of varname		
reset data; reset data component-list; reset delete de	include filename;	
in order to avoid that solutions details are automatically shared by solvers. reset data; This command resets only the information about the instance, not the model. This one resets only the specified data information in the data file. It update data; It updates data without deleting them. It updates data without deleting them. It updates data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes only the specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object with the one indicated. It flees the list of object with the one indicated. It relax that gain and the deleting or purging it is the companied on the one indicated. It flees the list of the model form the model of the problem indicated in the solution precision 10; It changes the value of the definition of the object name It changes the value of the object of the mod		
reset data; This command resets only the information about the instance, not the model. reset data component-list; This one resets only the specified data information in the data file. update data component-list; It updates data without deleting them. It updates data component-list; It updates only the specified data information in the data file. delete component-list; It updates only the specified data information in the data file. purge component-list; It updates only the specified data information in the data file. purge component-list; Similar to the previous one, it also deletes elements that depend from the one sin the component-list. ref component-name; It lists elements that depend from the one indicated. redeclare declaration; To redefine an item of the model (even without deleting or purging it) fix varname := value; It fixes the indicated variable to the given value unfix varname; It relaxes the specified constraints, telling the solver to ignore it while solving the problem restore constraint-name; It reintroduces the constraint previously relaxed. restore constraint-name; It reaves the specified constraints restore constraint-name; It reaves the specified constraints restore constraint-name; It reaves the specified constraints restore constraint-name; It reintroduces the constraint previously relaxed. restore constraint-name; It reintroduces the constraint previously relaxed. restore constraint-name; It reflects the list of the model (even without deleting or purging it) To define a parameter of the specified the solution let a set of objects of the model which parameters and variables are based on let define a set of objects of the model which parameters and variables are based on let define a variable which parameters and variables are based on let define a variable with previously relaxed. To define a parameter (i.e., constant numeric values) var X; To define a variable in the specified filename To introduce a constraint To introduce a constraint To repeat unit expression	reset;	
reset data component-list; update data; update data; Updates data without deleting them. update data; Updates only the specified data information in the data file. It updates only the specified data information in the data file. It updates only the specified data information in the data file. It updates only the specified data information in the data file. It updates only the specified data information in the data file. It updates only the specified data information in the data file. It delets the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; Similar to the previous one, it also deletes elements that depend from the ones in the component-list. The component-list; It is the specified data information in the data file. It delets the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object specified data information in the data file. It deletes the list of object data information in the data file. It deletes the list of object value deleting or purging it of the model (even without deleting or purging it) It fires the variable from previously set values It frees the variable from previously set values It relaxes the specified constraints, telling the solver to ignore it while solving the problem restore constraint-name; It relaxes the specified constraints, telling the solver to ignore it while solving the problem restore constraints options relax integrality 1; Or or relax integrality 1; Or or relax integrality 1; Or or relax integrality 2; Or or relax integrality 2; Or or relax integrality 2; Or or relax integrality 3; Or or relax integrality 4; Or or relax		
It updates data without deleting them. It updates data without deleting them. It updates data component-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from them purge component-list; Similar to the previous one, it also deletes elements that depend from the ones in the component-list.	reset data;	
inpdate data component-list; It updates only the specified data information in the data file.	reset data component-list;	
delete component-list; It deletes the list of object specified from the model of the problem, only if other items do not depend from then purge component-list; Similar to the previous one, it also deletes elements that depend from the ones in the component-list.		
purge component-list; Xref component-name; It lists elements that depend from the ones in the component-list. Xref component-name; It lists elements that depend from the one indicated. To redefine an item of the model (even without deleting or purging it) fix varname := value; If fixes the indicated variable to the given value unfix varname; It relaxes the specified constraints, telling the solver to ignore it while solving the problem restore constraint-name; It reintroduces the constraint previously relaxed. option relax_integrality 1; option relax_integrality 0; option solver_mag 0;	update data component-list;
